Domino Server Performance Best Practices - BP113

Kim Greene
President
Kim Greene Consulting, Inc.

Daniel Nashed
President
Nashed!Com

A holistic approach to Performance Management

- You need to take care about all levels
 - ◆ Hardware
 - Disk Drives, Memory, CPU, Network
 - ◆ Operating Systems
 - Parameters, Subsystems, ...
 - ◆ Notes Infrastructure
 - Server, Server settings, Transaction Log, ...
 - ◆ Databases & Database Settings
 - ◆ Applications
 - Use the right techniques designing & coding your applications

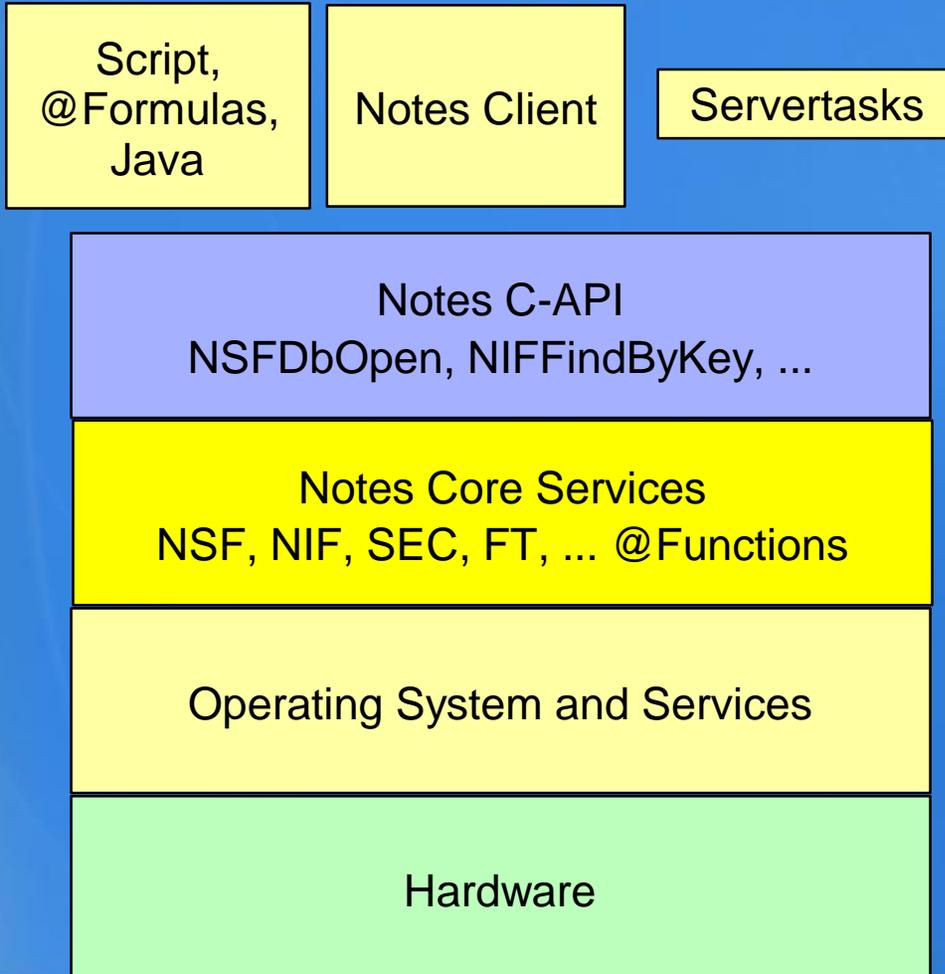

What Appears to Be the Problem?

- This is always Step #1
- Need clear understanding of performance problem
 - ◆ Are all users affected?
 - ◆ When is problem occurring?
 - ◆ What applications are running on system?
 - ◆ How long has performance problem been occurring?
 - ◆ Is the problem perceived response time problems?
 - ◆ Is the problem defined as high CPU utilization?

Do We Have a Healthy System?

- Step #2 involves determining if overall system is healthy
- A number of tools to use for this step
- Need to look at each of the following:
 - ◆ CPU
 - ◆ Memory
 - ◆ I/O
 - ◆ Network
- Some tools are "free" and some are "fee-based"

Overview Domino, OS and Hardware

Platform independent Notes C-API calls based on lower level core functions & routines

Notes Core services which encapsulate Notes and OS-specific functionality

Platform specific calls and services like NLS, memory management, TCP/IP, file services

Memory, Disk, CPU, other I/O devices

"Best platform for Domino?" really means "Which platform fits my environment?"

- Domino scales to the limit of the underlying platform
 - ◆ Linux is a good choice for small/medium workload
 - ◆ AIX, Solaris & iSeries are the right choice for larger systems
- A lot customers use Linux in DMZ for security reasons
 - ◆ (IPTables stateful packet filter in kernel, SSH, ...)
- Mixed environment with Linux for smaller servers and Unix for larger machines
 - ◆ With current Kernel 2.4 Linux is an excellent alternate platform for Windows based Intel machines
 - ◆ D7 with 2.6 kernel will really rock (IOCP support via sys-epoll)!
- AIX 5.x on Regatta Servers is great technology for consolidated server infrastructures - we have already customers using it.

Get the most out of your hardware

- Some resources within Domino are limited
 - ◆ Agent Manager, Indexer, Task Scheduler take a lot of time to go thru all databases
 - ◆ Control of concurrent access to databases needs to be coordinated (semaphores) also for backend access (NIF, ...)
- It makes sense to use partitioning to get most out of your hardware
 - ◆ In D6 Partitioning is part of the normal license
 - ◆ Use **PercentSysAvailResources=n**
- Even large boxes only scale if partitioned
 - ◆ Different platforms support different memory sizes
 - ◆ Don't use memory/buffer tuning if not really needed!

Memory (RAM)

- Memory is "relatively" cheap but can enhance performance a lot
 - ◆ Domino uses memory for internal caching/processing (e.g. NSF Buffers)
- On Unix check the security settings for resources limitations
 - ◆ e.g. AIX: /etc/security/limits
- Be aware of differences between shared memory (pools etc.) and local memory (per servertask)
- Windows can only use about 2,3 GB Memory for all partitions on a single box
 - ◆ Linux can use up to 4 GB per box on multiple partitions
 - ◆ AIX and Solaris 32Bit application running on 64Bit OS
 - each partition can benefit from an own 32Bit address space

Networking

- Make sure you have the right network infrastructure
 - ◆ Check bottlenecks between different parts of the network
 - ◆ Use switched networks and maybe a backbone for your servers
 - ◆ Do not use automatic speed/duplex settings for clients and servers!!
 - ◆ Make sure you use the right networking parameters for your environment like MTU (Domino will use it see e.g. LKB #192867 for Windows and search for iSeries and Unix)
 - ◆ Remove all network services/protocols you do not use
 - ◆ **netstat -an is your friend**

Domino Performance "Features"

- Use transaction log and View Rebuild
 - ◆ e.g. `view_rebuild_directory=c:\view_rebuild_dir\`
- Disable Unread Marks for system databases and other large databases
 - ◆ this can really speed up opening databases
- Enable multiple indexers
 - ◆ `notes.ini updaters=n`
- Discard View indexes if you don't use them
 - ◆ `DEFAULT_INDEX_LIFETIME_DAYS=days`

Performance Tips

- Large numbers of deletion stubs can make databases slow
- Be careful with FT index because it can block updaters from indexing other databases
- Don't schedule agents too often
- Disable tasks you do not need
 - ◆ sched task uses a lot of resources
- Have separate connection documents for mail and replication
 - ◆ this can help to finetune replication
 - ◆ also replicate different priorities at different times

"Extremely inefficient" Search Operations

- ◆ "Warning: Agent is performing full text operations on database 'xyz' which is not full text indexed. This is extremely inefficient."
(STR_AGENT_NOFULLTEXTINDEX)
- ◆ Agents with Search Queries always use FT index
 - If databases have no FT index a temporary on-the-fly FT index is created
 - D6: FT_FLY_INDEX_OFF=1 (TN #1161983) replaces old R5 zOS platform option: OS390_508_FTFLYMODE=1
 - Causes Agents using search operations on not FT indexed databases to fail
- ◆ Happens only in agents, Notes Client UI (View Search) uses a different way to search in databases without FT (caution: returns less results)
- ◆ Work-arounds
 - Use Mail-Rules (but that could cause other limitations)
 - Add logic into Script Agents to filter documents
 - Use unprocessed documents option and also set not matching docs to processed

Keep Domino versions updated

- Later versions have better performance (in most cases)
- e.g. Domino \geq R5.0.10 has some new technology from D6
 - ◆ Some customers reported big performance increase!
- Domino 6 really rocks!
 - ◆ A lot of areas are more optimized for performance
 - ◆ e.g. Network Compression, Streaming Replication, Rewritten @Formula Engine, Client Multitasking, Rewritten IMAP, full HTTP 1.1 support, Directory Changes, SCT, Optimized Logging, Enhanced Memory Management, ...
- D7 will bring even better performance -specially on Linux
 - ◆ see details in session ID116 Lotus Domino and Linux - Working Together for a Strong Future (Kenneth Brunsen, James Powers)

The Human Factor

- Check for private agents - Some users are really creative
- Control size of email messages
- Think if FT index on mailfiles is really needed
- Make sure people do shutdown their machines properly
 - ◆ hanging TCP/IP sessions can cause problems!
- Make sure power users do not have too much impact on server

Tuning your Domino Installation

- 1) Monitor your system over an extended period of time
- 2) Exercise caution when doing changes
- 3) Read and understand documentation
- 4) Keep records of all changes at any time
- 5) Only one change at a time
- 6) Be aware of potential side effects
- 7) Evaluate results over time
- 8) Apply next setting

Domino Server Statistics

- Statistics are collected automatically by different parts of the server
- There are different categories (Facilities) containing a large number of statistic values

- ◆ Example:

```
show stat mem.*
```

```
Mem.Allocated = 68863464
```

```
Mem.Allocated.Process = 8210820
```

```
Mem.Allocated.Shared = 60652644
```

```
Mem.Availability = Plentiful
```

```
Mem.Free = 870.449.152
```

```
Mem.PhysicalRAM = 160432128
```

```
6 statistics found
```

Working with Domino Statistics

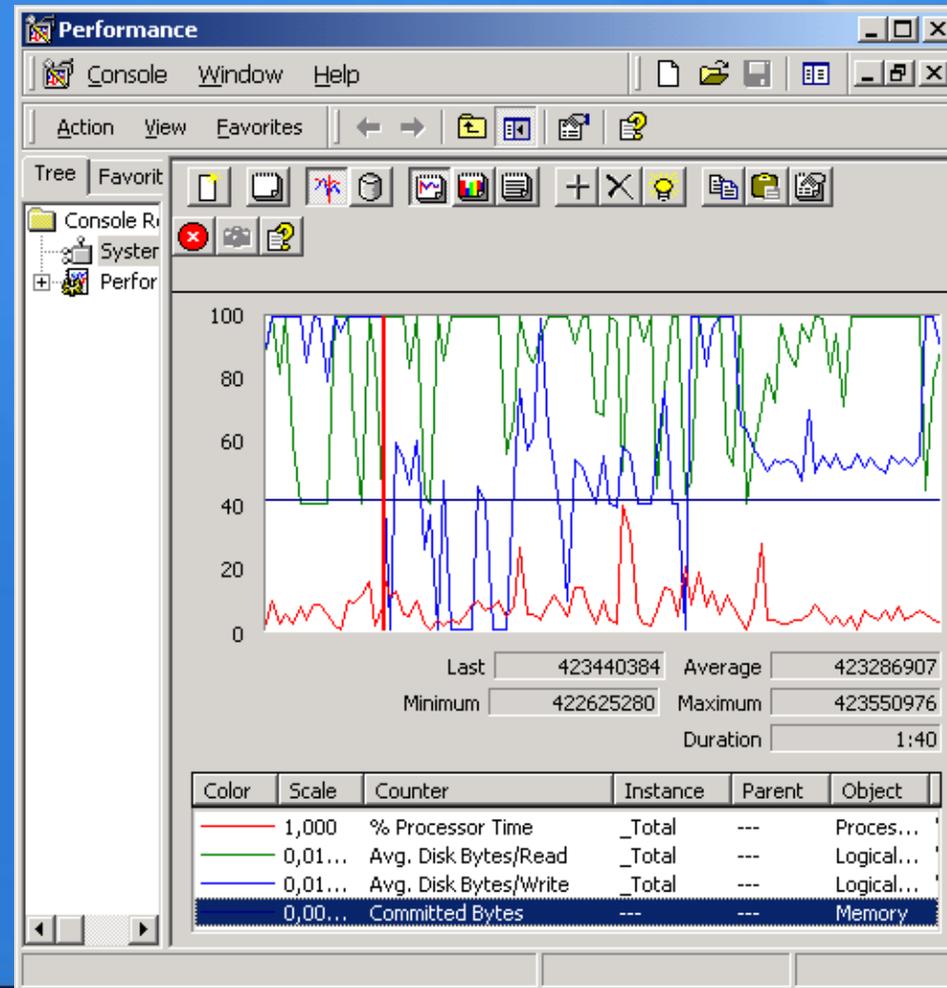

- Statistics can be collected in staprep.nsf
- Or displayed in the Admin Client (Real-time Statistic Charting)
- They are also data source for Historical Statistic Charting
- Each Servertasks/subsystem is responsible for maintaining their statistic values
 - ◆ Therefore right now there is no way to reset statistics
 - ◆ Statistics are resetted when sub-system is restarted (e.g. HTTP)

Platform Statistics

- A lot of information about system and resources
- provides comparable platform stats within Domino statistics
- Already in R5 for Win NT & Solaris
- available in Domino 6 on all platforms
- Enable via notes.ini
 - ◆ PLATFORM_STATISTICS_ENABLED=1 (R5)
 - ◆ Platform_Statistics_Disabled=1 (D6)
- show stat platform.*
- reset platform

Windows Perfmon

- Platform specific performance monitor
- Included in Windows
- has access to Notes Statistics if properly installed

Monitoring Performance on UNIX

- **iostat -x io**
 - ◆ statistics and activity
- **vmstat**
 - ◆ virtual memory activity and some CPU statistics
- **mpstat**
 - ◆ detailed look on CPU statistics
- **netstat -i**
 - ◆ summarizes network activity

UNIX - iostat

- iostat -x reports disk statistics
- Watch the %b column, values > 20 % need to be checked against high svt_t column.

extended device statistics									
device	r/s	w/s	kr/s	kw/s	wait	actv	svt_t	%w	%b
sd0	0.3	10.9	4.0	141.3	0.0	0.1	9.1	0	6

ssd27	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0	0
nfs1	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0	0

UNIX - vmstat

- vmstat summarizes virtual memory activity and some CPU statistics.
 - ◆ Monitor the sr column to keep track of scan rate.
 - ◆ us, sy and id columns to check CPU usage
 - ◆ r column threads are contenting for CPU time
 - should not be higher then about 4x the number of CPU's
 - ◆ Watch out for a high number of Context Switches (cs)

procs		memory		page				disk				faults		cpu						
r	b w	swap	free	re	mf	pi	po	fr	de	sr	s0	s1	s2	s3	in	sy	cs	us	sy	id
1	0 0	11051064	3121232	75	47	505	1 1	0	0	0	1	1	0	0	740	616	644	3	4	93

UNIX - mpstat

- mpstat 60 gives more detailed look on CPU
- watch out for high numbers in usr, sys or wt

CPU	minf	mjf	xcal	intr	ithr	csw	icsw	migr	smtx	srw	syscl	usr	sys	wt	idl
0	14	3	670	405	299	598	11	38	307	0	610	6	8	4	82
1	14	4	485	195	188	603	13	41	278	0	642	7	8	5	81
2	14	3	631	689	683	553	11	38	315	0	619	7	9	4	81
3	14	3	711	187	181	596	12	41	282	0	639	7	8	4	81
4	13	2	16	181	176	602	9	39	278	0	589	5	7	3	85
5	11	3	716	125	120	628	10	40	279	0	596	5	7	4	85
6	11	3	14	105	99	635	10	40	280	0	592	5	7	4	85
7	10	2	30	135	129	631	10	40	278	0	586	5	7	4	85
8	10	3	91	117	111	657	11	39	280	0	597	5	7	4	84
9	10	3	672	106	100	649	11	40	282	0	588	5	7	4	84
10	10	3	628	106	99	653	10	40	284	0	585	4	7	4	84
11	10	3	25	106	99	639	10	40	280	0	589	5	7	4	84
12	12	4	649	107	100	658	13	43	291	0	647	6	8	5	82
13	13	4	24	107	100	657	13	43	289	0	649	6	8	5	82
14	14	3	90	107	100	647	12	43	288	0	655	6	7	4	82
15	14	3	81	107	100	650	12	44	288	0	655	6	7	4	82

What is Happening on the Domino Server?

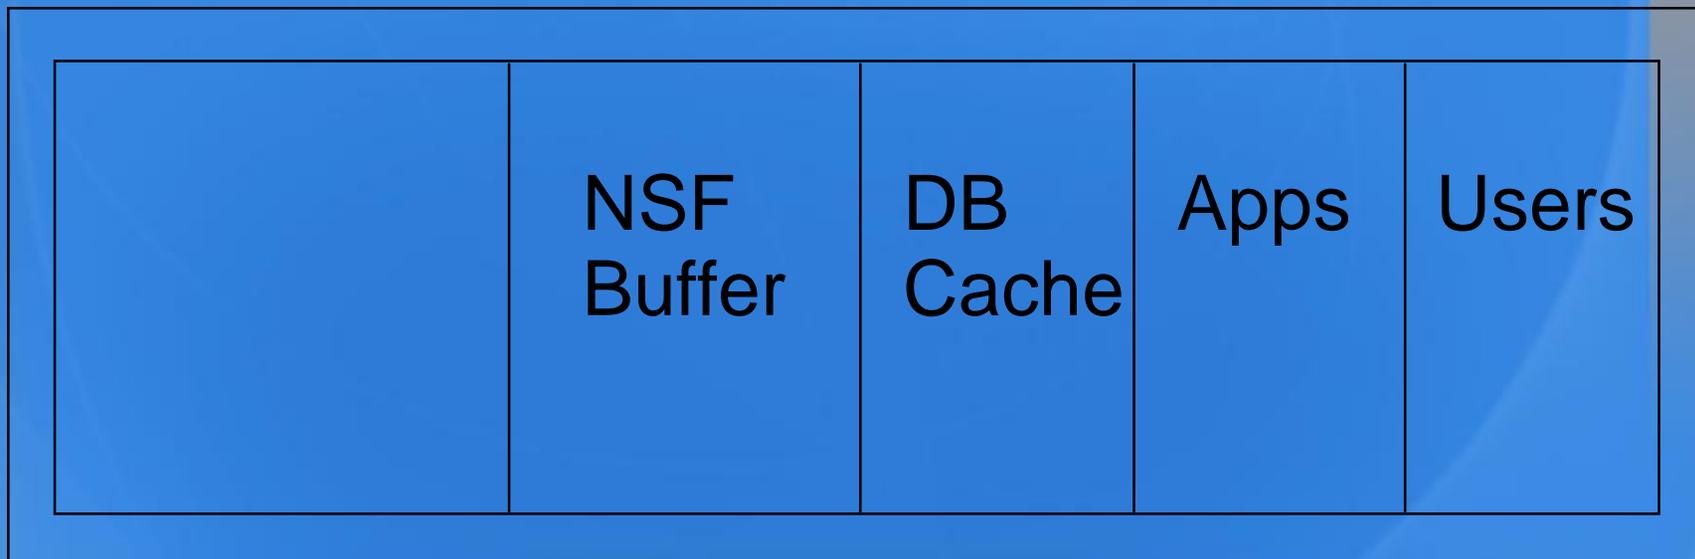

- Use Domino console commands
 - ◆ show task
 - lists which tasks are active for the Domino server
 - ◆ show task debug
 - undocumented command
 - provides job and thread number for SERVER tasks on iSeries
 - ◆ show stat
 - full set of Domino statistics for server
 - ◆ show stat domino
 - stats helpful when working with Domino Web server performance problem
 - ◆ tell http show thread state
 - shows which HTTP threads are waiting for work and which threads are currently servicing requests

What is Happening on the Domino Server?

- Use Domino console commands
 - ◆ show stat agent
 - agent stats such as:
 - ▶ scheduled runs, triggered runs, used run time, ...
 - ◆ tell amgr status
 - shows number of agents executing and agent concurrency setting
 - ◆ show stat database
 - provides key information on how Domino memory management is functioning
 - ◆ show database dir/dbname.nsf v
 - provides list of views and their sizes that are built over the database

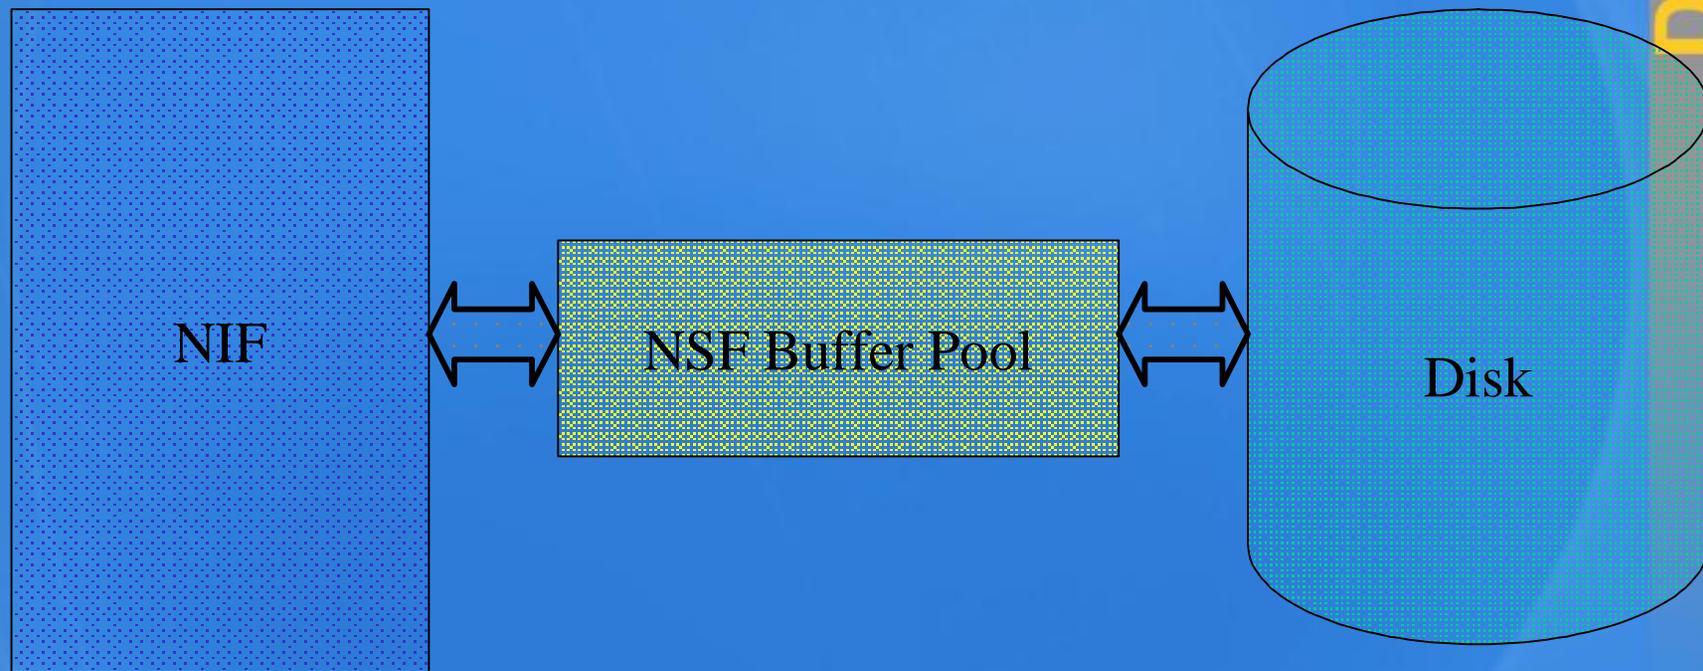

Domino Memory Management

- How Domino divides main storage
- Domino has it's own memory pools/buffers
- Memory subpools are dynamically adjusted by Domino

Domino Memory Management

- NSF Buffer Pool – what it does

Domino Memory Management

- **Domino database statistics**
 - ◆ Database.Database.BufferPool.Maximum.Megabytes
 - ◆ Database.Database.BufferPool.Peak.Megabytes
 - ◆ Database.Database.BufferPool.PercentReadsInBuffer
 - Want $\geq 95\%$
 - ◆ Database.DbCache.CurrentEntries
 - Number of entries in the database cache
 - ◆ Database.DbCache.HighWaterMark
 - Peak number of entries in db cache since Domino server was started
 - ◆ Database.DbCache.MaxEntries
 - Number of databases that can be cached
 - ◆ Database.DbCache.OvercrowdingRejections

Domino Memory Management

- Customer example – looking good
 - ◆ Database.Database.BufferPool.Maximum.Megabytes = 710
 - ◆ Database.Database.BufferPool.Peak.Megabytes = 708
 - ◆ Database.Database.BufferPool.PercentReadsInBuffer = 98.12
 - ◆ Database.DbCache.CurrentEntries = 71
 - ◆ Database.DbCache.HighWaterMark = 256
 - ◆ Database.DbCache.MaxEntries = 300
 - ◆ Database.DbCache.OvercrowdingRejections = 0

Domino Memory Management

- Customer example – looking very bad
 - ◆ Database.Database.BufferPool.Maximum.Megabytes = 170
 - ◆ Database.Database.BufferPool.Peak.Megabytes = 168
 - ◆ Database.Database.BufferPool.PercentReadsInBuffer = 95.44
 - ◆ Database.DbCache.CurrentEntries = 510
 - ◆ Database.DbCache.MaxEntries = 510
 - ◆ Database.DbCache.OvercrowdingRejections = 8385
 - Huge problem!
 - Options:
 - ▶ Increase NSF buffer pool size
 - ▶ Set NSF_DbCache_MaxEntries

Domino Memory Management

- Two key notes.ini parameters affect Domino memory management
 - ◆ NSF_Buffer_Pool_Size_MB
 - ◆ PercentAvailSysResources
- Other Domino memory buffers are allocated based on these parameters

Domino Memory Management

- **PercentAvailSysResources**
 - ◆ Introduced in R5.0.4
 - ◆ Controls % of memory resources available to Domino server
 - ◆ Valid values = 2% to 100%
 - ◆ Memory available depends on where Domino server is executing
 - ◆ Allows dynamic adjustment of buffer sizes

Domino Memory Management

- **NSF_Buffer_Pool_Size_MB**
 - ◆ Static setting of NSF buffer pool
 - ◆ Use in combination with PercentAvailSysResources
 - ◆ PercentAvailSysResources won't override NSF_Buffer_Pool_Size_MB setting

Domino Tuning - Overall Server Settings

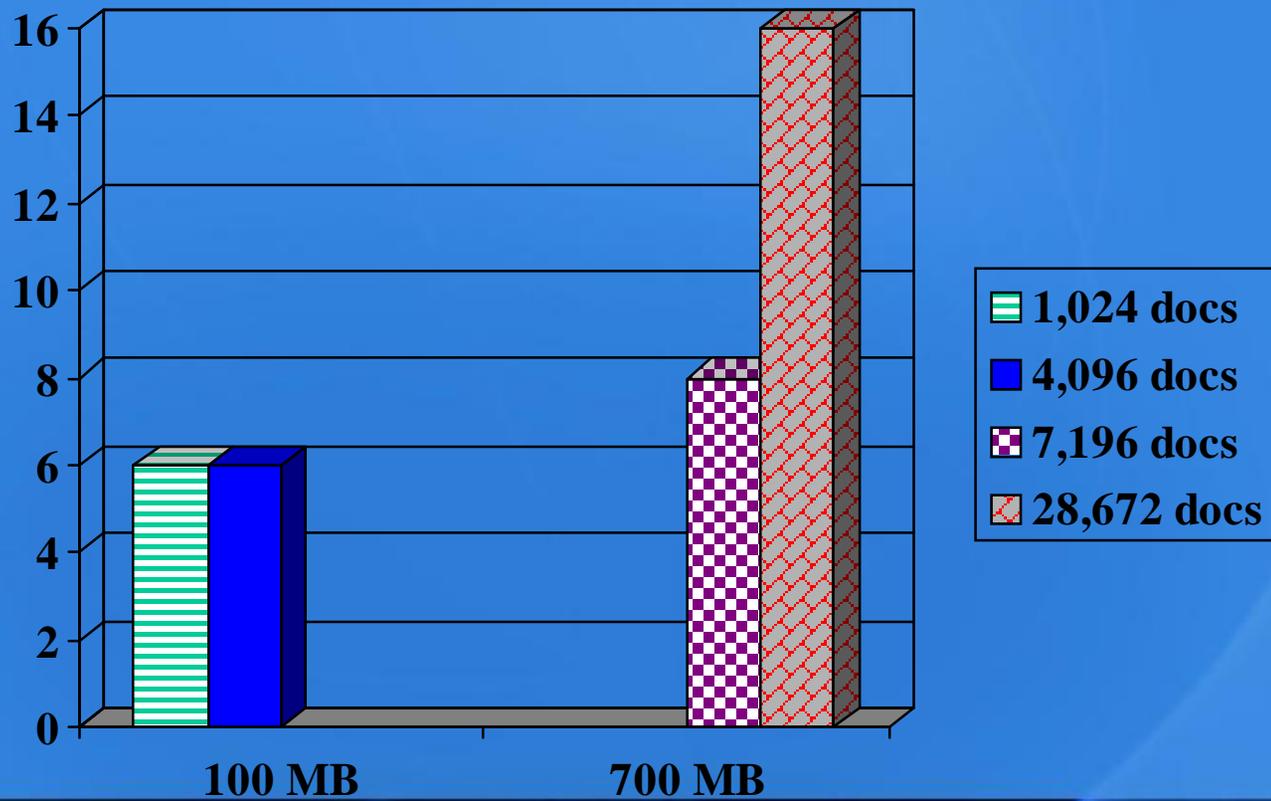

- **PercentAvailSysResources (notes.ini)**
 - ◆ Per partition memory size in % of total system memory.
 - ◆ Example: PercentAvailSysResources=50
- **NSF_BUFFER_POOL_SIZE(_MB)**
 - ◆ Buffer pool allocation per partition Domino server. Might be required if high number of memory > 4 GB RAM or old Domino release < 5.07. Can be 2000 MB at most per partition.
 - ◆ E.g. NSF_BUFFER_POOL_SIZE=2000
- **Don't use Buffer Pool Size if not really needed**
- **Use PercentAvailSysResources ONLY!!!**

Domino Tuning - Overall Server Settings

- **Server_Max_Concurrent_Trans (notes.ini)**
 - ◆ Server_Pool_Tasks (notes.ini)
 - ◆ For high number of NRPC connections increase the number of Server_Max_Concurrent_Trans to a high value (500-1000) and Server_Pool_Tasks parameter to 50 - 100 (number of server) threads.
- **NSF_DbCache_MaxEntries**
 - ◆ In case of high statistical value DbCache.OvercrowdingRejections set this to maximum number of concurrent users or the maximum number of databases open (whatever is higher)
 - ◆ e.g. NSF_DbCache_MaxEntries=10000

Mail Performance

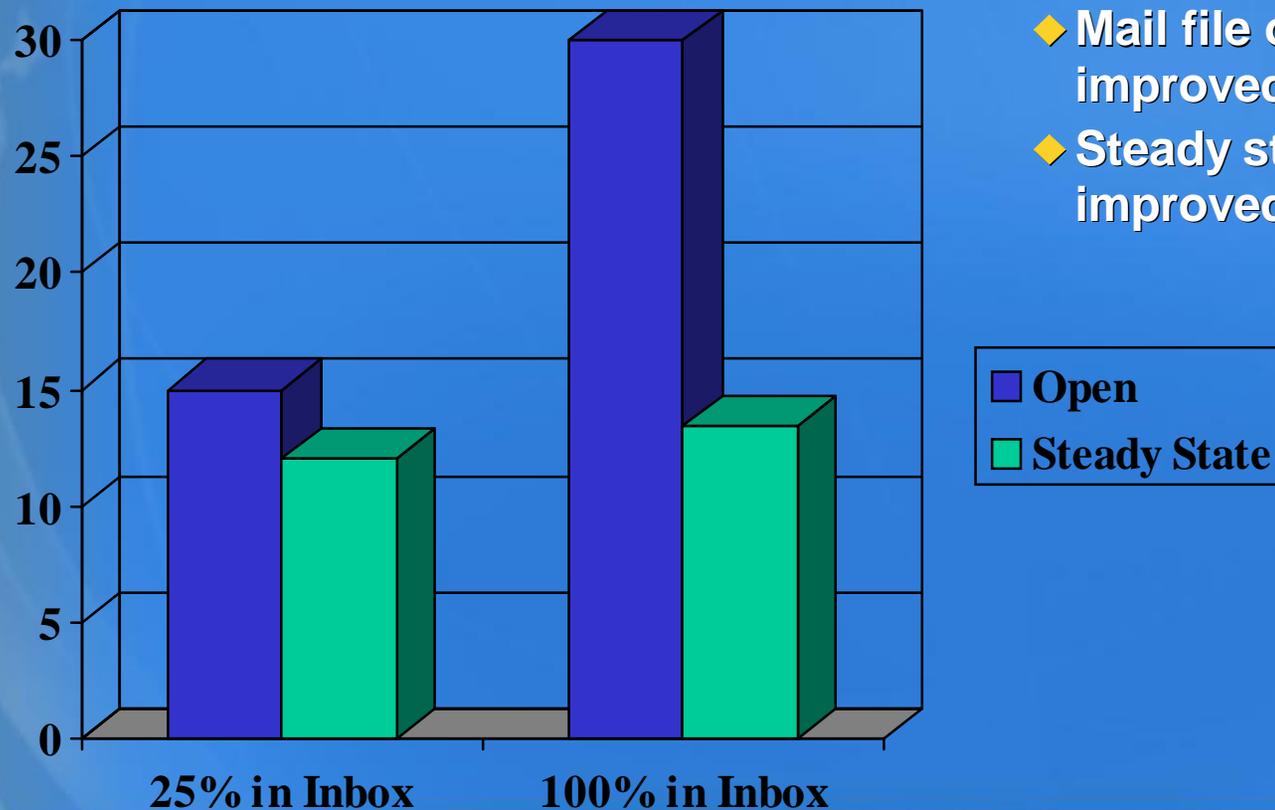

- Impact of number of documents
 - ◆ Number of documents has greater impact as file size grows

Mail Performance

- File those documents!
 - ◆ Inbox is most expensive container in a mail file
 - Updated each time user opens mail
 - Updated each time user clicks Refresh button
 - ◆ Reducing number of documents in Inbox reduces:
 - CPU utilization
 - Main storage required to update the view

Mail Performance

- Reducing number of documents stored in Inbox
 - ◆ Mail file open performance improved 50%
 - ◆ Steady state performance improved 12%

Mail File Performance Best Practices

- For optimal performance
 - ◆ Reduce overall document count in the file
 - Up to 2X CPU reduction
 - ◆ Keep number of documents stored in Inbox to a minimum
- Full text indexing and searching
 - ◆ Full text indexing is cheap
 - CPU usage increase < 0.5%
 - ◆ Searches are expensive
 - 20% extra CPU
 - ◆ Moral of the story
 - Create permanent indexes if using FTI function

Mail File Performance

- Mail statistics to watch
 - ◆ Mail.Waiting
 - Indicator of ROUTER performance
 - Number of mail items waiting to be delivered in all MAIL.BOX files
 - May indicate need additional files
 - ◆ Mail.TotalPending
 - Number of mail messages resident in all MAIL.BOX files
 - Includes all dead, held, and pending mail

HTTP Statistics

- Some Important statistic values
 - ◆ `Http.Worker.Total.BytesRead` = 27.366
 - ◆ `Http.Worker.Total.BytesWritten` = 368.333

 - ◆ `Http.Worker.Total.File.Requests` = 13
 - ◆ `Http.Worker.Total.File.RequestTime` = 971

 - ◆ `Http.Worker.Total.Notes.Requests` = 70
 - ◆ `Http.Worker.Total.Notes.RequestTime` = 18.490

 - ◆ `Http.Worker.Total.TotalRequestTime` = 19.46

D6 HTTP Cache Settings

- General Setting is still there but moved
- Cache settings are still on Domino Web Engine Tab

HTTP Domino Web Engine DIIOP LDAP	
Basics	
Host name(s):	217.146.151.106
Bind to host name:	Enabled
DNS lookup:	Disabled
DNS lookup cache:	Enabled
DNS lookup cache size:	256
DNS lookup cache found timeout:	120 seconds
DNS lookup cache not found timeout:	240 seconds
Number active threads:	40
R5 Basics	
Allow HTTP clients to browse databases:	<input type="radio"/> Yes <input checked="" type="radio"/> No
Maximum requests over a single connection:	1
Minimum active threads: (Prior to 4.6 only)	20
Default home page:	nshweb/pages/home.htm
Maximum cached commands:	128
Optimize HTTP performance based on the following primary	Advanced (Custom Settings)

Domino Platform Tuning AIX - 1

- **AIX Kernel Settings**
 - ◆ MaxUProc - maximum number of processes that a single user account can run. set this to at least 128.
 - ◆ check the current value with: `lsattr -E1 sys0 -a maxuproc`
- **AIX Domino Server Account Settings**
 - ◆ `AIXTHREAD_SCOPE=S` (default in Domino 6)

Domino Platform Tuning AIX - 2

- AIX Domino Server Account Settings
 - ◆ /etc/security/limits
 - data = (min 3 x default value)
 - stack = (min 3x default value)
 - rss = (min 3 x default value)
 - nfiles = (min 3 x default value) - don't set it to unlimited
- Page Space adjustments
 - ◆ /etc/inittab/vmtune (best is to have no paging)
 - ◆ Page space 2x the amount of RAM
 - ◆ if server uses > 20% paging space (check via `lsps -a`) us
 - ◆ /usr/samples/kernel/vmtune -P 50 (down to 20)

Domino Platform Tuning AIX - 3

- Network Tuning

- ◆ tune to ensure large amounts of data can be transferred and received. Minimum of tx_queues should be 512.
- ◆ To view current settings :
- ◆ lsdev -Cc adapter -s available (list adapters)
- ◆ lsattr -e1 <adapter> |grep size (list queue sizes)

- Default Socket Buffers

- ◆ Set send/receive window size to 16384 Bytes.
- ◆ check via no -a command.
- ◆ tcp_sendspace=16384
- ◆ tcp_recvspace=16384
- ◆ sb_max=65536

Domino Platform Tuning Solaris - 1

- File descriptors limits
 - ◆ increase number of file descriptors in `/etc/system`
 - ◆ set `rlim_fd_max=65536` (mandatory)
 - ◆ Memory tuning improves system response for heavily used filesystems. Cachefree settings should be 1/16 (up to 1/6) of physical memory divided by 8192 to get 8 KB pages.
 - ◆ **set `priority_paging=1` and `cachefree=8192` (for a 1GB) (only for Solaris 6 and 7)**
- High filesystem page (RunFaster=1)
 - ◆ To avoid high file system page in rates adjusts % of memory kernel will map into address space for file system cache.
 - ◆ **set `segmap_percent=20` (default 12 up to 60)**

Domino Platform Tuning Solaris - 2

- Excessive filesystem flush daemon overhead
 - ◆ On very busy Domino servers with a lot of I/O limit the CPU cycles that the file system flush daemon can use.
 - ◆ **set autoup=600**
 - ◆ **set tune_t_fsflushr=1**
 - ◆ this wakes up the fsflush daemon once a second and allows older pages to remain in memory before being flushed to disk
- Throttled page daemon I/O
 - ◆ For multiple swap disks or 10'000 RPS disk you should increase the I/O rate of the page daemon.
 - ◆ **set maxpgio=16384**

Domino Platform Tuning Linux - 1

- Kernel Parameter
 - ◆ Two ways to set kernel parameters
 - ◆ Example SuSE: `echo "8192" >/proc/sys/fs/file-max`
 - ◆ Example RedHat: file `/etc/sysctl.conf: fs.file-max=49152`
- Number of open files
 - ◆ `fs.file-max=49152`
 - ◆ `fs.inode-max = 3*fs.file-max`
 - ◆ check actual values: `echo /proc/sys/fs/file-no; inode-nr & inode-state`

Domino Platform Tuning Linux - 2

- Increase maximum number of shared memory segments
 - ◆ `kernel.shmmni=8192`
- Increase maximum number of system-wide semaphores
 - ◆ `kernel.sem=250 18432 32 1024`
- Increase maximum number of threads
 - ◆ `/proc/sys/kernel/threads-max`

Domino Platform Tuning Linux - 3

- **Limits**
 - ◆ you need the following line in all /etc/pam.d/* control files like /etc/pam.d/login,su,... to ensure limits can be set
 - ◆ session required /lib/security/pam_limits.so
- **Number of open files for notes**
 - ◆ user/etc/security/limits.conf
 - ◆ notes soft nofile 49152
 - ◆ notes hard nofile 49152
- **Number of processes/threads notes**
 - ◆ user/etc/security/limits.conf
 - ◆ notes soft nproc 12500
 - ◆ notes hard nproc 12500

Domino Platform Tuning Linux - 4

- ◆ IPC/Shared Memory (Domino specific)
- ◆ export Notes_SHARED_DPOOLSIZE=2000000 to enalarge the shared memory segments allocated
- ◆ Set the "noatime" attribute flag to disable the file access modified timestamp on all filesystems for Domino, /var, /tmp in /etc/fstab
- Some additional paramters to check
 - ◆ /proc/sys/vm/buffermem
 - ◆ /proc/sys/vm/bdflush
 - ◆ There is a lot stuff to tune on Linux

Domino for Linux Hard Disks Tuning

- Default settings for disks are very conservative
 - ◆ Tune settings with `hdparm`
 - ◆ `hdparm -A1 -a8 -c3 -d1 -Xnn -W1 devicename`
 - (-A) sets drive read lookahead flag
 - (-a) sets FS read ahead. 8 sectors (4KB) to 12 sectors (6KB)
 - (-c) sets EIDE 32bit I/O support
 - (-d) enables DMA
 - (-X) sets the DMA mode (see man page for details)
 - (-W) IDE write caching mode (possible data lost when crash!)
 - ◆ Example: `hdparm -A1 -a8 -c3 -d1 -Xnn -W1 devicename`
 - ◆ Test Performance before and after with
 - (-t) perform device read timings
 - (-T) perform cache read timings

CPU utilization (interactive): .00 % Transactions: 10 Disk % busy: .12 %

Domino Subsystem Tuning - iSeries

- Change individual job priority permanently
 - ◆ Very useful when specific task is consuming large amounts of CPU
 - ◆ Helpful when have Domino running on same system as interactive applications
- Steps to follow:
 - ◆ Create a class in library QUSRNOTES
 - **CRTCLS CLS(QUSRNOTES/MAILCLASS) RUNPTY(30)**
 - ◆ Tell Domino which task (or tasks) should use this class
 - **EDTF ('/qibm/userdata/lotus/notes/domino_classes')**

Domin Subsystem Tuning - iSeries

- Contents of domino_classes file:

SERVER=Mail01

CLASS=mailclass

TASKS=calconn,router

CLASS=mailclass2

TASKS=sched

SERVER=App01

CLASS=appclass

TASKS=Amgr

Domino Subsystem Tuning - iSeries

- All tasks can be changed except for:
 - ◆ QNNINSTS
- Software requirements
 - ◆ Domino for iSeries R5 or D6
 - ◆ OS/400 V4R3 or later
